2. Plato believed God to be an infinitely wise, just, and powerful Spirit; and also that he formed the visible universe out of preexistent amorphous matter, according to perfect patterns of ideas eternally existent in his own mind. Philosophy he considered as being a knowledge of the true nature of things, as discoverable in those eternal ideas after which all things were fashioned. In other words, it is the knowledge of what is eternal, exists necessarily, and is unchangeable; not of the temporary, the dependent, and changeable; and of course it is not obtained through the senses; neither is it the product of the understanding, which concerns itself only with the variable and the transitory; nor is it the result of experience and observation; but it is the product of our *reason*, which, as partaking of the divine nature, has innate ideas resembling the eternal ideas of God. By contemplating these innate ideas, reasoning about them, and comparing them with their copies in the visible universe, reason can attain that true knowledge of things which is called *philosophy*. Thus the focus and directrix are pole and polar. There are also poles and polar curves to curves of higher degree than the second, and poles and polar planes to surfaces of the second degree.

Polar-ization (*-ī-zā-shūn*), *n.* [*Cf. F. polarisation*.] 1. The act of polarizing; the state of being polarized, or of having polarity.

2. (*Opt.*) A peculiar affection or condition of the rays of light or heat, in consequence of which they exhibit different properties in different directions.

[*E.*] If a beam of light, which has been reflected from a plate of unsilvered glass at an angle of about 56° , be received upon a second plate of glass similar to the former, and at the same angle of incidence, the light will be readily reflected when the two planes of incidence are parallel to each other, but will not be reflected when the two planes of incidence are perpendicular to each other. The light has, therefore, acquired new properties by reflection from the first plate of glass, and is called *polarized light*, while the modification which the light has experienced by this reflection is called *polarization*. The plane in which the beam of light is reflected from the first mirror is called the *plane of polarization*. The angle of polarization is the angle at which a beam of light must be reflected, in order that the polarization may be the most complete. The term *polarization* was derived from the theory of emission, and it was conceived that each luminous molecule was two poles analogous to the poles of a magnet; but this view is not now held. According to the undulatory theory, ordinary light is produced by vibrations transverse or perpendicular to the direction of the ray, and so distributed as to show no distinction as to any particular direction. But when, by any means, these vibrations are made to take place in one plane, the light is said to be *plane polarized*. If only a portion of the vibrations lie in one plane the ray is said to be *partially polarized*. Light may be polarized by several methods other than by reflection, as by refraction through most crystalline media, or by being transmitted obliquely through several plates of glass with parallel faces. If a beam of polarized light be transmitted through a crystal of quartz in the direction of its axis, the plane of polarization will be changed

by an angle proportional to the thickness of the crystal. This phenomenon is called *rotatory polarization*. A beam of light reflected from a metallic surface, or from glass surfaces under certain peculiar conditions, acquires properties still more complex, its vibrations being no longer rectilinear, but circular, or elliptical. This phenomenon is called *circular or elliptical polarization*.

3. (*Elec.*) An effect produced upon the plates of a voltaic battery, or the electrodes in an electrolytic cell, by the deposition upon them of the gases liberated by the action of the current. It is chiefly due to the hydrogen, and results in an increase of the resistance, and the setting up of an opposing electro-motive force, both of which tend materially to weaken the current of the battery, or that passing through the cell.

1. The relation or adaptation of one portion to another, or to the whole, as respects magnitude, quantity, or degree; comparative relation; ratio; as, the *proportion* of the parts of a building, or of the body.

The image of Christ, made after his own *proportion*. *Ridley.*

4. A part considered comparatively; a share.

5. (*Math.*) (a) The equality or similarity of ratios, especially of geometrical ratios; or a relation among quantities such that the quotient of the first divided by the second is equal to that of the third divided by the fourth; — called also *geometrical proportion*, in distinction from *arithmetical proportion*, or that in which the difference of the first and second is equal to the difference of the third and fourth.

(b) *Proportion* in the mathematical sense differs from *ratio*. *Ratio* is the relation of two quantities of the same kind, as the ratio of 5 to 10, or the ratio of 8 to 16. *Proportion* is the sameness or likeness of two such relations. Thus, 5 is to 10 as 8 to 16; that is, 5 bears the same relation to 10 as 8 does to 16. Hence, such numbers are said to be in *proportion*. *Proportion* is expressed by symbols thus:

$a : b :: c : d$, or $a : b = c : d$, or $\frac{a}{b} = \frac{c}{d}$.

(b) The rule of three, in arithmetic, in which the three given terms, together with the one sought, are proportional.

Inverse proportion, etc. See under **CONTINUED**, **INVERSE**, etc. — **HARMONICAL**, or **MUSICAL**, *proportion*, a relation of three or four quantities, such that the first is to the last as the difference between the first two is to the difference between the last two; thus, 2, 3, 6, are in harmonic proportion; for 2 is to 6 as 1 to 3. Thus, 24, 16, 12, 9, are harmonic, for 24 : 9 :: 16 : 12. — **In proportion**, according as; to the degree that. "In *proportion* as they are metaphysically true, they are morally and politically false." *Burke.*

The pulley, as one of the mechanical powers, consists, in its simplest form, of a grooved wheel, called a sheave, turning within a movable frame or block, by means of a cord or rope attached at one end to a fixed point. The force, acting on the free end of the rope, is thus doubled, but can move the load through only half the space traversed by itself. The rope may also pass over a sheave in another block that is fixed. The end of the rope may be fastened to the movable block, instead of a fixed point, with an additional gain of power, and using either one or two sheaves in the fixed block. Other sheaves may be added, and the power multiplied accordingly. Such an apparatus is called by workmen a block and tackle, or a fall and tackle. See *BLOCK*. Pulse, *n.* [*OE. pous, OF. pous, F. pouls*, fr. *L. pulsus* (sc. *venarum*), the beating of the pulse, the pulse, from *pellere*, *pulsus*, to beat, strike; cf. *Gr. πάλλειν* to swing, shake, *πέσσειν* to shake. Cf. *APPAL*, *COMPEL*, *IMPEL*, *PUSH*.] 1. (*Physiol.*) The beating or throbbing of the heart or blood vessels, especially of the arteries.

In an artery the pulse is due to the expansion and contraction of the elastic walls of the artery by the action of the heart upon the column of blood in the arterial system. On the commencement of the diastole of the ventricle, the semilunar valves are closed, and the aorta recoils by its elasticity so as to force part of its contents into the vessels farther onwards. These, in turn, as they already contain a certain quantity of blood, expand, recover by an elastic recoil, and transmit the movement with diminished intensity. Thus a series of movements, gradually diminishing in intensity, pass along the arterial system (see the Note under *HEART*). For the sake of convenience, the radial artery at the wrist is generally chosen to detect the precise character of the pulse. The pulse rate varies with age, position, sex, stature, physical and psychological influences, etc.

2. Any measured or regular beat; any short, quick motion, regularly repeated, as of a medium in the transmission of light, sound, etc.; oscillation; vibration; pulsation; impulse; beat; movement.

Pulse glass, an instrument consisting of a glass tube with terminal bulbs, and containing either oil or alcohol, which the heat of the hand causes to boil; — so called from the *pulsating* motion of the liquid when thus warmed. — **Pulse wave** (*Physiol.*), the wave of increased pressure started by the ventricular systole, radiating from the semilunar valves over the arterial system, and gradually disappearing in the smaller branches.

The pulse wave travels over the arterial system at the rate of about 50 feet in a second. *H. N. Martin*.

If the vote is in the affirmative, the matter before the body must be voted upon as it then stands, without further general debate or the submission of new amendments. In the House of Representatives of the United States, and generally in America, a negative decision operates to keep the business before the body as if the motion had not been made; but in the English Parliament, it operates to postpone consideration for the day, and until the subject may be again introduced. In American practice, the object of the motion is to hasten action, and it is made by a friend of the measure. In English practice, the object is to get rid of the subject for the time being, and the motion is made with a purpose of voting against it. *Cushing*. — To beg the *question*. R.

R (*Ar.*). R, the eighteenth letter of the English alphabet, is a vocal consonant. It is sometimes called a *semivowel*, and a *liquid*. See *Guide to Pronunciation*, §§ 178, 179, and 250-254. "R is the dog's letter and hurroth in the sound." *R. Jonson.*

In words derived from the Greek language the letter *h* is generally written after *r* to represent the aspirated sound of the Greek *ρ*, but does not affect the pronunciation of the English word, as *rhapsody, rhetoric*.

The English letter derives its form from the Greek through the Latin, the Greek letter being derived from the Phœnician, which, it is believed, is ultimately of Egyptian origin. Etymologically, R is most closely related to *l*, *s*, and *n*; as in *bandre*, *mandore*; purple, *L. purpura*; *E. chapter*, *F. chapitre*, *L. capitulum*; *E. was*, *were*; *hare*, *G. hare*; *E. order*, *F. ordre*, *L. ordo*, *ordinis*; *E. coffer*, *coffin*.

Syn. — Argumentation; argument. — *REASONING*, ARGUMENTATION. Few words are more interchanged than these; and yet, technically, there is a difference between them. Reasoning is the broader term, including both deduction and induction. Argumentation denotes simply the former, and descends from the whole to some included part; while reasoning embraces also the latter, and ascends from the parts to a whole. See *INDUCTION*.

Reasoning is occupied with ideas and their relations; argumentation has to do with the forms of logic. A thesis is set down; you attack, I defend it; you insist, I reply; you deny, I prove; you distinguish, I destroy your distinctions; my reply balance or overturn your objections. Such is argumentation. It supposes that there are two sides, and that both agree to the same rules. Reasoning, on the other hand, is often a natural process, by which we form, from the general analogy of nature, or special presumptions in the case, conclusions which have greater or less degrees of force, and which may be strengthened or weakened by subsequent experience.

5. (Math.) Used to denote different kinds of mutual relation; often with reference to the substitution of reciprocals for given quantities. See the Phrases below.

Reciprocal equation (Math.), one which remains unchanged in form when the reciprocal of the unknown quantity is substituted for that quantity. — **Reciprocal figures** (Geom.), two figures of the same kind (as triangles, parallelograms, prisms, etc.), so related that two sides of the one form the extremes of a proportion of which the means are the two corresponding sides of the other; in general, two figures so related that the first corresponds in some special way to the second, and the second corresponds in the same way to the first. — **Reciprocal proportion** (Math.), a proportion such that, of four terms taken in order, the first has to the second the same ratio which the fourth has to the third, or the first has to the second the same ratio which the reciprocal of the third has to the reciprocal of the fourth. Thus, 2:5::20:8 form a reciprocal proportion, because 2:5:: $\frac{1}{2}$: $\frac{1}{5}$. — **Reciprocal quantities** (Math.), any two quantities which produce unity when multiplied together. — **Reciprocal ratio** (Math.), the ratio between the reciprocals of two quantities; as, the reciprocal ratio of 4 to 9 is that of $\frac{1}{4}$ to $\frac{1}{9}$. — **Reciprocal terms** (Logic), those terms which have the same signification, and, consequently, are convertible, and may be used for each other.

Syn. — Mutual; alternate. — **RECIPROCAL**. **MUTUAL**. The distinctive idea of mutual is, that the parties unite by interchange in the same act; as, a mutual covenant; mutual affection, etc. The distinctive idea of reciprocal is, that one party acts by way of return or response to something previously done by the other party; as, a reciprocal kindness; reciprocal reproaches, etc. Love is reciprocal when the previous affection of one party has drawn forth the attachment of the other. To make it mutual in the strictest sense, the two parties should have fallen in love at the same time; but as the result is the same, the two words are here used interchangeably. The ebbing and flowing of the tide is a case where the action is reciprocal, but not mutual.

to be deducted from the apparent altitude of a heavenly body on account of atmospheric refraction, in order to obtain the true altitude.

Angle of refraction (*Opt.*), the angle which a refracted ray makes with the perpendicular to the surface separating the two media traversed by the ray. — **Conical refraction** (*Opt.*), the refraction of a ray of light into an infinite number of rays, forming a hollow cone. This occurs when a ray of light is passed through crystals of some substances, under certain circumstances. Conical refraction is of two kinds: *external conical refraction*, in which the ray issues from the crystal in the form of a cone, the vertex of which is at the point of emergence; and *internal conical refraction*, in which the ray is changed into the form of a cone on entering the crystal, from which it issues in the form of a hollow cylinder. This singular phenomenon was first discovered by Sir W. R. Hamilton by mathematical reasoning alone, unaided by experiment. — **Differential refraction** (*Astron.*), the change of the apparent place of one object relative to a second object near it, due to refraction; also, the correction required to be made to the observed relative places of the two bodies. — **Double refraction** (*Opt.*), the refraction of light in two directions, which produces two distinct images. The power of double refraction is possessed by all crystals except those of the isometric system. A uniaxial crystal is said to be *positive* (like quartz), or *optically negative* (like calcite), or to have *positive* or *negative*, *double refraction*, according as the optic axis is the axis of least or greatest elasticity for light; a biaxial crystal is similarly designated when the same relation holds for the acute bisectrix. — **Index of refraction.** See under INDEX. — **Refraction circle** (*Opt.*), an instrument provided with a graduated circle for the measurement of refraction. — **Refraction of latitude, longitude, declination, right ascension, etc.**, the change in the apparent latitude, longitude, etc., of a heavenly body, due to the effect of atmospheric refraction. — **Terrestrial refraction**, the change in the apparent altitude of a distant point on or near the earth's surface, as the top of a mountain, arising from the passage of light from it to the eye through atmospheric strata of varying density.

As distinguished from *piety*, *religion* is a high sense of moral obligation and spirit of reverence or worship which affect the heart of man with respect to the Deity, while *piety*, which first expressed the feelings of a child toward a parent, is used for that filial sentiment of veneration and love which we owe to the father of all. Re-move (rē-mōv'), v. t. To change place in any manner, or to make a change in place; to move or go from one residence, position, or place to another.

Till Birnam wood remove to Dunsinane, I can not taint with fear. *Shak.*

The verb *remove*, in some of its applications, is synonymous with *move*, but not in all. Thus we do not apply *remove* to a mere change of posture, without a change of place or the seat of a thing. A man moves his head when he turns it, or his finger when he bends it, but he does not *remove* it. *Remove* usually or always denotes a change of place in a body, but we never apply it to a regular, continued course or motion. We never say the wind or water, or a ship, *removes* at a certain rate by the hour; but we say a ship was *removed* from one place in a harbor to another. *Move* is a generic term, including the sense of *remove*, which is more generally applied to a change from one station or permanent position, stand, or seat, to another station.
